The Kalmus Ratio© – a better measure of cost effectiveness

We typically use cost per pupil as the measure of cost effectiveness for K-12 school districts. The measure is relatively easy to calculate. We take total expenditures and divide it by the school district enrollment. While enrollment can be defined in various ways, most cost per pupil measures use average daily membership (ADM) in the calculation.

Unfortunately, cost per pupil does not account for student performance. School districts can get their cost per pupil down by cutting costs irrespective of impact on student achievement. Eliminate professional development, cutting edge technology, enrichment courses, engaging learning experiences, and leadership from a district and the cost per pupil goes down. But what happens to student achievement? It often declines, but the reduced effectiveness isn't a part of the cost per pupil measure.

We need a new measure of cost effectiveness that includes costs AND effectiveness (think student achievement). The new measure is the **Kalmus Ratio – the cost per successful student**. First used at Butler Technology and Career Development Schools in Ohio to drive student performance and effective investment, the measure marries the importance of managing costs with advancing student achievement. It is a flexible concept that allows for unique definitions of student success. It can also be applied to any cost unit including departments, schools, districts, or a state.

$$\text{Kalmus Ratio}^{\text{©}} = \frac{\$ \text{ expended}}{\text{Student success points}}$$

Defining success

This report defines student success as passage of state academic tests. The assumption is the state of Oklahoma assesses what is important to the state and its educational system. These tests are administered to all school district types and are used to consistently measure actual student achievement. This report further refines test passage for purposes of calculating the Kalmus Ratio as follows

Test result	Student success points earned ¹
Advanced	1.2
Proficient	1.0
Limited/Basic	0.3
Unsatisfactory/Below Basic	0.0

Further refinement of student success is possible with the Kalmus Ratio. Additions to the definition of student success can include industry credential attainment, ACT results, and broader assessment options. None of these were collected or available during the analysis period and therefore were not included in this analysis.

Adjusting for the challenge of poverty

Poverty doesn't determine student success, but it does increase the challenges of getting to success. The Kalmus Ratio in this report has been adjusted to account for this challenge. Each student in poverty increases the value of success by .25. This is the same percentage adjustment provided to schools for students in poverty. The adjustment increases the number of student success points a school district earns. For example, a district with 100 proficient students would typically earn 100 student success points. If the district poverty rate is 50%, those same 100 proficient students would earn 112.5 student success points.

The adjustment accounts for the challenge. The more successful the district, the better their Kalmus Ratio.

Defining costs

This report defined costs to be the school district costs reported by the Oklahoma Department of Education's OCAS system. All expenditures and all funds were used to assure a full financial picture was used in the analysis. The only exception was Fund 41. It was removed from the analysis because it "double counts" another Fund.

Consideration of less complete sets of financial data were considered, but other approaches lacked the stability across districts and across fiscal years to be valid. There were some missing financial data in the OCAS system. For districts with incomplete data, the financial reports from the Office of Educational Quality and Accountability were used to maximize districts included in the analysis.

What causes increased costs?

The simple answer is schools spend more. But this doesn't account for the impact of federal and state impacts on the local decision-making process. The Kalmus Ratio does not differentiate between federal, state, or local decisions. It simply reports the costs on

¹ Success points are used to quantify student achievement.

student success basis. Reducing the Kalmus Ratio can be achieved by increasing performance or lower costs. Ideally a district has the latitude to do both.

Unfortunately, federal and state decisions have performance and financial consequences. Often, a higher Kalmus Ratio comes from a federal or state requirement that limits local decision making and thus drives up costs or lowers performance or both.

The Kalmus Ratio should be applied to state and federal decisions, not just local decisions.

Second report in a series

This is the second report in the series of Kalmus reports for Oklahoma. The first report contains more detailed information regarding FY2014 through FY2016. This report contains some past information for these years plus a focus on FY2017 and FY2018. This report breaks out the virtual school districts for separate analysis.

The data sets available for reporting high school level student success were not available from the Oklahoma Department of Education. This missing data caused the Kalmus Ratio to go up generally and created substantial negative impact on districts with grades 9-12.

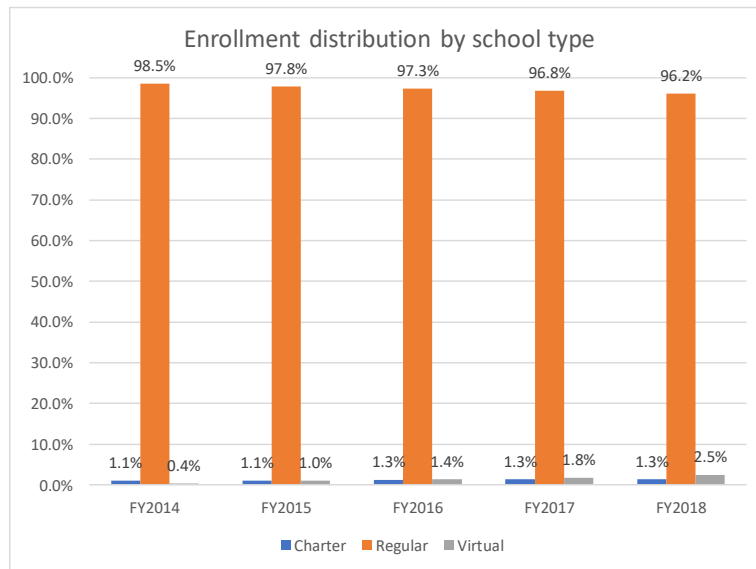

The decision to drop end of course assessments created a reduction in student success expectations. These expectations manifest themselves logically in the Kalmus Ratio calculation. State policies have consequences. In this case, a reduced expectation for student success without a lowering of expenses results in higher costs per successful student.

Analysis of Oklahoma cost effectiveness

Overall analysis and trends

Enrollment

Oklahoma enrollment in PK-12 school districts is relatively stable over the five years studied. Growth has been faster in charter and virtual schools than regular districts. Virtual enrollment is particularly fast growing. Charter and virtual enrollment now represents 3.8% of total state enrollment, up from 1.5% in FY2014.

Average enrollment per school district has also grown. Virtual schools have shown rapid average enrollment growth.

Enrollment is heavily concentrated in a small group of schools. Oklahoma City and Tulsa are the largest districts, each with just under 40,000 students. Edmond, Moore, and Putnam City round out the top five largest. The remaining school districts tend to be very small and financial analyses show great disparities in performance because of the extreme variations in enrollment within each school district. The five smallest districts Nashoba, Straight, White Oak, Davidson, and Terral, all have less than 50 students. As of FY2018, 54% of all Oklahoma school districts had less than 500 students enrolled.

Poverty and students with disabilities rates are virtually unchanged over the FY2014-FY2018 analysis period. Average poverty rates were 69% in FY2018 with charters at the highest rates and virtual schools at the lowest.

Financial

All per pupil expenditure amounts have grown slightly over the five-year analysis period. Charter schools lag regular districts in expenditures. This would be anticipated as charters have no local tax base from which to draw resources. There is no correlation ($r^2=.02$) between expenditures per pupil and student academic achievement. Spending on students does not predict corresponding changes in student success. Virtual school expenditures are flat to declining and are well below regular or charter districts.

Increasing per pupil expenditures combined with slight enrollment growth have moved expenditures higher. Charter and virtual expenditures as a percent of total expenditures moved up from 1.2% to 2.3% during the analysis period. This is consistent with enrollment growth. Their expenditures barely register when compared to regular districts.

Student achievement

Student achievement saw a significant decline in the final two years of the analysis. Declines hit all types of school districts. Changes in state assessment strategies appear to be a major contributor to this phenomenon, however, recent National Assessment of Education Progress (NAEP) results declined for Oklahoma indicating a fundamental decline in performance system wide.

Cost effectiveness

Cost effectiveness declined dramatically during the final two years of the analysis period. The cost for passage of academic assessments as weighted for level of achievement and poverty (poverty adjusted weighted Kalmus Ratio) has increased from an average \$7,812 to \$21,285. Charter schools and virtual schools fared better than regular districts with charter schools posting an improvement from FY2017 to FY2018.

The primary reasons for the change in cost effectiveness were

1. **A reduction in the number of assessments administered.** The per enrollment average number of tests dropped from 1.6 in FY2016 to 1.5 in FY2017. FY2018 continued the decline in assessments. These changes reduced performance expectations for schools.
2. **Dramatic drop in student proficiency** on remaining assessments.

There were no significant changes in enrollment or expenditures that would have dramatically impacted cost effectiveness.

Good
↓

Cost effectiveness as measured by the Kalmus Ratio is correlated with per pupil expenditures but is not the same ($r^2 = .59$). Individual schools can vary significantly between a cost per pupil and a cost per successful test passage as adjusted for proficiency level and poverty.

FY2017 analysis

Student achievement

Student achievement varies dramatically across districts. Some very small schools are susceptible to significant fluctuation due to small numbers of test takers. However, any district over 500 students should be able to stabilize student achievement and implement reforms required to improve results over time. Oklahoma's future depends on a relentless focus on this goal.

FY2017 Percent of Students Achieving Proficient or Higher

Financial

Expenditures per pupil are consistent across the state except for a few extreme outliers on each end of the spectrum. Charter and virtual schools tend to have the lowest per pupil expenditures and small districts tend to have the highest per pupil expenditures.

Cost effectiveness

Cost effectiveness, as determined by the Poverty Adjusted Weighted Kalmus Ratio, varies significantly across school districts. Please note: some very small schools (student n < 150) may have missing test data due to FERPA reporting requirements. Cost effectiveness, as with student achievement, tends to parallel school district size. The smaller the district the lower the cost effectiveness.

Some districts expend tremendous resources for limited student achievement. Many others, while spending higher sums on a per pupil basis, find their costs per test passed much lower than anticipated.

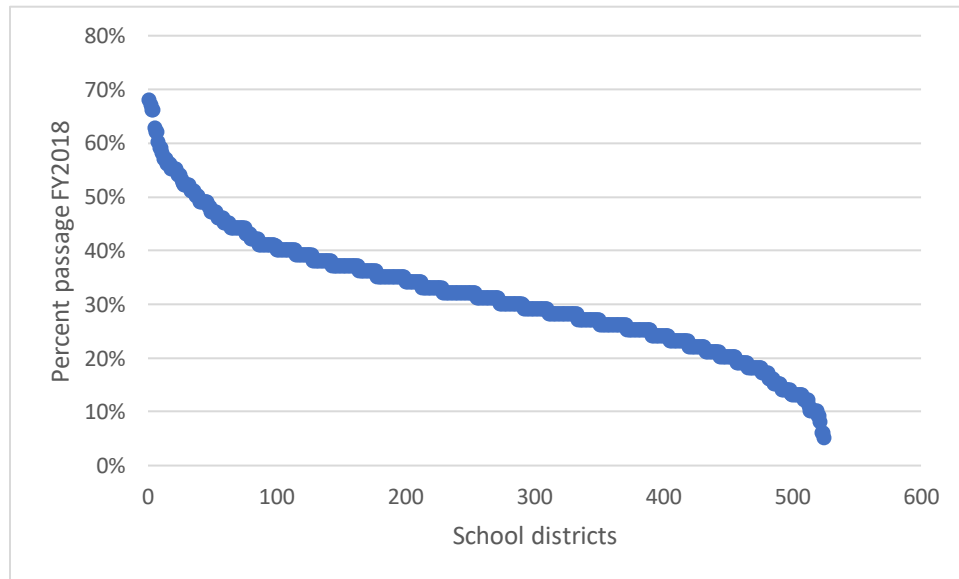

FY2018 analysis

Student achievement

Student performance results continued to vary significantly by school district in FY2018.

FY2018 Percent of Students Achieving Proficient or Higher

Financial

Expenditures per pupil were substantially the same in FY2018 as they were in FY2017 when considering the variation among districts.

Cost effectiveness

Cost effectiveness, as measured by the Kalmus Ratio, continued to show results consistent with FY2017. This is consistent with the relatively static nature of student performance, a slight increase in expenditures, and a slight increase in student enrollment. High cost outliers continue to plague the system.

FY2017 and FY2018 showed much higher costs per successful student. Again, this was the result of dramatically fewer assessments and much lower achievement rates.

Tables

The following tables show the top 40 school districts in each of the analysis data sets.
